

Scotland had another generally frosty start, along with parts of N Ireland and N England, followed by showers which were widespread, and wintry over Scotland. Over southern districts there was widespread rain during the night, with thunder at first in the extreme SE, and sleet over high ground in the S Midlands which turned to snow in the Midlands and Wales as a precipitation area extended north. It remained dull and damp across much of the south with temperatures struggling to rise above 4C in many areas in a cool E flow. By contrast, 12-13C was recorded in the extreme SW corner of England and in the Channel Islands.
